This assignment does not count toward the final grade.

Important Information for the Exam

Overview

This assessment is an **on-campus, invigilated, timed and timetabled exam** designed to assess students' understanding of the deep learning concepts and techniques covered throughout the whole semester. The assessment is **worth 40% of the total marks in this course**. The assessment focuses on assessing students' ability to understand and critically analyse deep learning concepts and techniques, and apply them to solve different deep learning problems.

The assessment will be conducted on **Tuesday (27 October) from 12:30 PM to 2:50 PM at the RMIT Melbourne campus**. Each student will be allocated to one of the three large rooms in Building 80 (the sheet consisting of student names and their allocated rooms will be sent out closer to the exam date). **Students are required to be at their allocated room 30 minutes in advance** to check in using their RMIT student cards.

The exam consists of questions covering any concepts and techniques taught in the course (see *Topics Covered* below for more detailed information).

What You Will Need to Bring

- Your RMIT student card to check in
- Your prepared handwritten A4 cheat sheet (one-page, one-sided)
- A pen to write answers on the answer sheets
- Your laptop and mobile phone to transfer paper-based answers to Canvas (see *Assessment Process* below)

Student Allocated Room

Each student will be allocated to one of the three large rooms in Building 80 (the sheet consisting of student names and their allocated rooms will be sent out closer to the exam date). You are **required to attend your allocated room** and **arrive 30 minutes before the assessment start time** to complete check-in using your RMIT student card.

Assessment Process

The assessment will be conducted under invigilated conditions on campus with the following duration:

- 120 minutes working time
- 20 minutes for transferring paper-based answers to Canvas

Students will be provided with printed question papers and answer sheets and will write their answers on the answer sheets. Each student is allowed to bring one handwritten A4 cheat sheet (one-page, one-sided) into the assessment room.

During the working time, no electronic devices can be used.

During the answer transferring time, students are not allowed to continue working on the assessment and can only transfer their existing answers from the answer sheets to Canvas. This involves: (1) selecting answers (for multiple choice questions) in the Canvas quiz, and (2) uploading photos of written answers (for short answer questions and problem solving questions) to the Canvas assignment.

Laptops and mobile phones can only be used during this transfer period to access Canvas and transfer/upload the answers.

Topics Covered

The assessment may cover any knowledge taught throughout the semester, including before-class material and during-class (lectorial and tutorial/lab) material. The assessment may also cover concepts and techniques investigated in the two assignments.

Question Types

The assessment consists of three different question types designed to evaluate different aspects of students' understanding and application of deep learning concepts and techniques.

1. **Multiple Choice Questions:** These questions assess students' understanding of deep learning concepts, techniques, architectures, and their properties. A question may contain one or multiple correct answers. Students should select all correct choices and avoid selecting incorrect choices. Selecting an incorrect choice will result in a mark deduction.
2. **Short Answer Questions***:* These questions require students to briefly explain, analyse, or justify deep learning concepts, techniques, or design choices. Students may be asked to explain why a particular approach is or is not appropriate, compare different approaches, interpret model behaviour or results, suggest an appropriate solution to a given problem, etc. Answers should be concise and directly address the question.
3. **Problem-Solving Questions:** Each questions presents a deep learning problem or application scenario followed by several smaller, structured sub-questions. Students may be required to apply concepts and techniques learned in the course, analyse model behaviour or performance, compare or select appropriate approaches, suggest and justify possible solutions or improvements, etc. Each sub-question focuses on a particular step or aspect of the overall problem.

Practice Test

A practice test will be made available in Week 9.

Special Consideration

If you have any concerns, hardships, or expect that you won't be able to attend this assessment at the above-arranged time, please apply for **Special Consideration** through RMIT. The application

requires students to provide relevant supporting documentation and evidence for assessment. A list of example circumstances and required supporting documentation can be found under the Frequently Asked Questions of the **Special Consideration page**.
